

PSoC 6 Current Digital to Analog Converter (IDAC7)

1.0

Features

- Six current ranges (4.96 uA to 635 uA)
- Sink or Source current
- 7-bit resolution
- Two IDACs can be put in parallel to form an 8-bit IDAC
- Add external resistor for VDAC functionality

General Description

The IDAC7 Component provides a programmable current with a resolution of 7 bits. The six overlapping ranges are from 4.96 uA to 635 uA, which allows sufficient resolution for most applications.

When to Use a IDAC7 Component

- Resistance measurements
- Current sink or source
- Capacitance measurements other than CapSense
- Sensor current
- Temperature measurement (diode sensor)

Definitions

- DAC – Digital to Analog Converter
- IDAC – Current Digital to Analog Converter
- VDAC – Voltage Digital to Analog Converter
- CSDV2 – Capacitive Sigma Delta version 2

PRELIMINARY

Quick Start

1. Drag an IDAC7 Component from the Component Catalog *Cypress/Analog/DAC* folder onto your schematic (the placed instance takes the name IDAC7_1).
2. Double-click to open the Configure dialog, and set the desired range and current parameters.
3. Drag an Analog Pin from the Component Catalog *Cypress/Ports and Pins* folder onto your schematic (the placed instance takes the name Pin_1). Connect it to the IDAC7_1 output.
4. Build the project in order to verify the correctness of your design and generate the configuration data for the IDAC7_1 instance.
5. In *main.c*, initialize the peripheral and start the application:

```
IDAC7_1_Start();
```

6. Build and program the device.

Input/Output Connections

Iout – Analog

This is the connection to the DAC's current source/sink.

Component Parameters

The IDAC7 Component Configure dialog allows you to edit the configuration parameters for the Component instance.

PRELIMINARY

General Tab

This tab contains the Component parameters used in the general peripheral initialization settings.

Name	Description
Polarity	<p>Selects either a current sink or source initial configuration.</p> <p>Parameter Options:</p> <ul style="list-style-type: none"> Positive (Source) (default) Negative (Sink) <p>Note: If Polarity is Negative, the current value is correct for output voltages between Vdda and 0.6V. If Polarity is Positive, the current value is correct for output voltages between Vdda-0.6V and ground (0V).</p>
Range	<p>Selects one of six overlapping current ranges.</p> <p>Parameter Options:</p> <ul style="list-style-type: none"> 0-4.96 uA (39.06 nA/bit) (default) 0-9.922 uA (78.125 nA/bit) 0-39.69 uA (312.5 nA/bit) 0-79.38 uA (625 nA/bit) 0-317.5 uA (2.5 uA/bit) 0-635.0 uA (5.0 uA/bit)

Name	Description
Value	<p>Selects the initial value of the current sink or source.</p> <p>Parameter Options:</p> <ul style="list-style-type: none"> 0 to 7F (default 40)

Application Programming Interface

Application Programming Interface (API) routines allow you to configure the Component using software.

By default, PSoC Creator assigns the instance name IDAC7_1 to the first instance of a Component in a given design. It can be renamed to any unique value that follows the syntactic rules for identifiers. The instance name becomes the prefix of every global function name, variable, and constant symbol. For readability, the instance name used in the following table is "IDAC7".

- [General APIs](#)
General APIs are used for run-time configuration of the Component during active power mode.
- [Power Management APIs](#)
Power management APIs perform the necessary configurations to the Components to prepare it for entering low power modes.

General APIs

General APIs are used for run-time configuration of the Component during active power mode. These include, initializing, starting, stopping, reading from registers and writing to registers.

Functions

- void [IDAC7_Init](#) (void)
- void [IDAC7_Enable](#) (void)
- void [IDAC7_Start](#) (void)
- void [IDAC7_Stop](#) (void)
- void [IDAC7_SetValue](#) (uint32 current)
- void [IDAC7_SetPolarity](#) (uint32 polarity)
- void [IDAC7_SetRange](#) (uint32 range)

Function Documentation

void IDAC7_Init (void)

Initializes all initial parameters and operating modes.

PRELIMINARY

void IDAC7_Enable (void)

Enables the IDAC for operation

void IDAC7_Start (void)

Initializes all parameters required to setup the Component as defined in the customizer.

Global Variables

IDAC7_initVar - this variable is used to indicate the initial configuration of this Component. The variable is initialized to zero and set to 1 the first time [IDAC7_Start\(\)](#) is called. This allows the Component initialization without re-initialization in all subsequent calls to the [IDAC7_Start\(\)](#) routine.

void IDAC7_Stop (void)

The Stop is not required.

void IDAC7_SetValue (uint32 current)

Sets the IDAC current to the new value.

Parameters:

<i>uint32</i>	current: Current value
---------------	------------------------

void IDAC7_SetPolarity (uint32 polarity)

Sets polarity to either sink or source.

Parameters:

<i>uint32</i>	polarity: Current polarity <ul style="list-style-type: none"> – IDAC7_POL_SOURCE : Source polarity – IDAC7_POL_SINK : Sink polarity
---------------	---

void IDAC7_SetRange (uint32 range)

Sets the IDAC range to one of six ranges.

Parameters:

<i>uint32</i>	range: Current range <ul style="list-style-type: none"> – IDAC7_RNG_4_96UA : 39.06 nA/bit current range – IDAC7_RNG_9_922UA : 78.125 nA/bit current range – IDAC7_RNG_39_69UA : 312.5 nA/bit current range – IDAC7_RNG_79_38UA : 625 nA/bit current range – IDAC7_RNG_317_5UA : 2.5 uA/bit current range – IDAC7_RNG_635_0UA : 5.0 uA/bit current range
---------------	---

Power Management APIs

Power management APIs perform the necessary configurations to the Components to prepare it for entering low power modes.

These APIs must be used if the intent is to put the chip to sleep, then to continue the Component operation when it comes back to active power mode.

Functions

- void [IDAC7_Sleep](#) (void)
- void [IDAC7_Wakeup](#) (void)

Function Documentation

void IDAC7_Sleep (void)

Stores all volatile settings and powers down the IDAC7.

void IDAC7_Wakeup (void)

Restores settings and power after wakeup that were saved by the Sleep function.

Global Variables

The IDAC7 Component populates the following peripheral initialization data structure(s). The generated code is placed in C source and header files that are named after the instance of the Component (e.g. IDAC7_1.c). Each variable is also prefixed with the instance name of the Component.

uint8 IDAC7_initVar

The instance-specific configuration structure. This should be used in the Init() function.

Code Examples and Application Notes

Code Examples

PSoC Creator provides access to code examples in the Code Example dialog. For Component-specific examples, open the dialog from the Component Catalog or an instance of the Component in a schematic. For general examples, open the dialog from the Start Page or **File** menu. As needed, use the **Filter Options** in the dialog to narrow the list of projects available to select.

Refer to the "Code Example" topic in the PSoC Creator Help for more information.

There are also numerous code examples that include schematics and example code available online at the [Cypress Code Examples web page](#).

PRELIMINARY

API Memory Usage

The Component memory usage varies significantly depending on the compiler, device, number of APIs used and Component configuration. The following table provides the memory usage for all APIs available in the given Component configuration.

The measurements have been done with an associated compiler configured in Release mode with optimization set for Size. For a specific design, the map file generated by the compiler can be analyzed to determine the memory usage.

PSoC 6 (GCC)

Configuration	PSoC 6	
	Flash Bytes	SRAM Bytes
All	252	4

Functional Description

The 7-bit current DAC (IDAC7) is based on the CapSense block (CSDV2).

Block Diagram and Configuration

A simplified diagram of the IDAC7 hardware is shown below:

The IDAC7 Component uses `cy_mxs40_csidad` primitive. It is configured using the CSDV2 block configuration registers only.

DMA Support

The IDAC7 Component supports Direct Memory Access (DMA) transfers. The Component may transfer to/from the following sources.

Name of DMA Source/ Destination in the DMA Wizard	Length	Direction	DMA Req Signal	DMA Req Type	Description
IDAC7_IDAC_CONTROL_PTR	32 bit	Source/ Destination	N/A	N/A	This register is intended to control the IDAC settings. See the device Technical Reference Manual (TRM) for details.

Note DMA support in the IDAC7 Component is limited due to the following reasons:

- The IDAC7_IDAC_CONTROL register is common for the IDAC setting and IDAC current value.

Before using the DMA channel with the IDAC7 Component, review the description of this register in the device registers Technical Reference Manual (TRM).

Placement

The PSoC 6 IDACs are part of the CapSense CSDV2 hardware block. Two 7-bit IDACs are available.

Industry Standards

MISRA Compliance

This section describes the MISRA-C:2004 compliance and deviations for the Component. There are two types of deviations defined:

- project deviations – deviations that are applicable for all PSoC Creator Components
- specific deviations – deviations that are applicable only for this Component

This section provides information on Component-specific deviations. Project deviations are described in the MISRA Compliance section of the *System Reference Guide* along with information on the MISRA compliance verification environment.

The IDAC7 component has the following specific deviations:

Rule	Rule Class (Required/Advisory)	Rule Description	Description of Deviation(s)
1.1	R	Number of macro definitions exceeds 1024 - program does not conform strictly to ISO:C90.	The IDAC component generates macros for the registers. For some configurations numbers of macros can exceeds 1024 (ISO90).
10.1	A	A non-constant expression of 'essentially unsigned' type (%1s) is being converted to signed type, '%2s' on assignment.	The cast from unsigned int does not have any unintended effect, as it is a consequence of the definition of a structure based on hardware registers.

Registers

See the device [Technical Reference Manual \(TRM\)](#) for more information about the registers.

PRELIMINARY

Resources

The IDAC7 Component uses the CSDV2 IDAC peripheral block.

DC and AC Electrical Characteristics

TBD

Component Changes

This section lists the major changes in the Component from the previous version.

Version	Description of Changes	Reason for Changes / Impact
1.0	Initial Version
